

**ASSIGNMENT 2**

Project Name: Intelligent Vehicle Damage Assessment &amp; Cost Estimator for Insurance Companies

**Name : Danush Hari****Roll Number : 720719104042****▼ Download the dataset**

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

**▼ 2.Load the Data Set**

```
dataset = pd.read_csv('/content/Churn_Modelling.csv')
```

```
#dropping row number columns as we already have index column by default
dataset.drop(['RowNumber'], axis=1,inplace=True)
```

dataset

	CustomerId	Surname	CreditScore	Geography	Gender	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	Es
0	15634602	Hargrave	619	France	Female	42	2	0.00	1	1	1

```
dataset['Gender'].value_counts().plot.bar()
```

<matplotlib.axes.\_subplots.AxesSubplot at 0x7ff371c2c190>

```
dataset['Geography'].value_counts().plot.bar()
```

<matplotlib.axes.\_subplots.AxesSubplot at 0x7ff371cd1f90>

## ▼ Bi - Variate Analysis

```
g = sns.pairplot(dataset, diag_kind="kde", markers="+",
                  plot_kws=dict(s=50, edgecolor="b", linewidth=1),
                  diag_kws=dict(shade=True))
```

```
import matplotlib.pyplot as plt
```

```
#create scatterplot of hours vs. score
plt.scatter(dataset.Age[30], dataset.Balance[30])
```

```
plt.title('Age vs. Balance')
plt.xlabel('Age')
plt.ylabel('Balance')
```

```
dataset.plot.hexbin(x='Age', y='CreditScore', gridsize=10)
```

## Multi-variate Analysis

```
dataset.corr()
```

```
sns.set(font_scale=0.50)
plt.figure(figsize=(8,4))
sns.heatmap(dataset.corr(),cmap='RdBu_r', annot=True, vmin=-1, vmax=1)
```

```
#Three variables - Multivaraiate
sns.barplot(x='Age', y='Geography', data=dataset, palette='bright',hue='Gender')
```

## 4 . Descriptive statistics

```
import statistics as st
```

```
dataset[['Age', 'Balance', 'EstimatedSalary']].mean()
```

```
dataset.info()
```

```
dataset.describe()
```

```
dataset['Age'].median()
```

```
standard_deviation = dataset['CreditScore'].std()
print(standard_deviation)
```

```
st.mode(dataset['Geography'])
```

```
st.median(dataset['Age'])
```

```
st.variance(dataset['CreditScore'])
```

## 5 . Handle Missing Values

```
dataset.isnull().sum() #no missing values
```

## 6 . Find and replace outliers

```
sns.boxplot(dataset['CreditScore'],data=dataset)
```

```
dataset['Balance'].hist()
```

```
for col in num_cols[1:]:
    print('skewness value of ',col,dataset[col].skew())
```

```
#Skewness should be in the range of -1 to 1, any columns with skewness outside of that range would have outliers
```

```
Q1=dataset['Age'].quantile(0.25)
Q3=dataset['Age'].quantile(0.75)
```

```
IQR=Q3-Q1
```

```
IQR
```

```
#Values above than the upper bound and below than the lower bound are considered outliers
```

```
upper = dataset['Age'] >= (Q3+1.5*IQR)
```

```
# print("Upper bound:",upper)
print(np.where(upper))
```

```
lower = dataset['Age'] <= (Q1-1.5*IQR)
# print("Lower bound:", lower)
print(np.where(lower))
```

```
#Removing outliers based off Age column
```

```
# IQR
Q1 = np.percentile(dataset['Age'], 25,
                    interpolation = 'midpoint')
```

```
Q3 = np.percentile(dataset['Age'], 75,
                    interpolation = 'midpoint')
```

```
IQR = Q3 - Q1
```

```
print("Old Shape: ", dataset.shape)
```

```
# Upper bound
upper = np.where(dataset['Age'] >= (Q3+1.5*IQR))
# Lower bound
lower = np.where(dataset['Age'] <= (Q1-1.5*IQR))
```

```
''' Removing the Outliers '''
dataset.drop(upper[0], inplace = True)
dataset.drop(lower[0], inplace = True)
```

```
print("New Shape: ", dataset.shape)
```

```
dataset
```

```
for col in num_cols[1:]:
    print('skewness value of ',col,dataset[col].skew())
```

```
# Now we have reduced the Age column's skewness values within -1 to 1 range
# We left the Exited column's skewness value as it is the dependent variable
```

## 7 . Check for Categorical columns and perform encoding

Label encoding and One Hot encoding

```
dataset.reset_index(inplace=True)
```

```
from sklearn.preprocessing import LabelEncoder
from sklearn.preprocessing import OneHotEncoder
from sklearn.compose import ColumnTransformer
```

```
categorical_feature_mask = dataset.dtypes==object
categorical_cols = dataset.columns[categorical_feature_mask].tolist()
```

```
categorical_cols=categorical_cols[1:]
categorical_cols
```

```
le = LabelEncoder()
dataset[categorical_cols] = dataset[categorical_cols].apply(lambda col: le.fit_transform(col))
dataset[categorical_cols].head(10)
```

```
categorical_feature_mask
```

```

enc=OneHotEncoder()
enc_data=pd.DataFrame(enc.fit_transform(dataset[['Geography','Gender']]).toarray())
enc_data

#First three columns of enc_data is for Geography and the next two columns is for Gender, we can replace the already existing cate

#Dropping already existing Geography and Gender columns
dataset.drop(['Geography'], axis=1,inplace=True)
dataset.drop(['Gender'], axis=1,inplace=True)

dataset.insert(2, "Geography_France", enc_data.iloc[:,0], True)
dataset.insert(3, "Geography_Germany", enc_data.iloc[:,1], True)
dataset.insert(4, "Geography_Spain", enc_data.iloc[:,2], True)
dataset.insert(5, "Gender_Female", enc_data.iloc[:,3], True)
dataset.insert(6, "Gender_Male", enc_data.iloc[:,4], True)

```

```
dataset
```

```

# We drop some irrelevant columns that does not contribute to prediction
dataset.drop(columns="CustomerId",axis=1,inplace=True)
dataset.drop(columns="Surname",axis=1,inplace=True)
dataset.drop(columns="index",axis=1,inplace=True)

```

```
dataset
```

## ▼ 8 . Split the data into dependent and independent variables

```

X= dataset.iloc[:, :-1].values #Independent variables
y= dataset.iloc[:, -1].values #Dependent variables

```

```
X
```

```

array([[1.0000000e+00, 0.0000000e+00, 0.0000000e+00, ..., 1.0000000e+00,
