ASSIGNMENT 2

Project Name: Intelligent Vehicle Damage Assessment & Cost Estimator for Insurance Companies

Name: GOWTHAM P

Roll Number: 720719104063

Download the dataset

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

2.Load the Data Set

dataset = pd.read_csv('/content/Churn_Modelling.csv')

#dropping row number columns as we already have index column by default dataset.drop(['RowNumber'], axis=1,inplace=True)

dataset

	CustomerId	Surname	CreditScore	Geography	Gender	Age	Tenure	Balance	NumOfProducts	HasCrCard	IsActiveMember	
0	15634602	Hargrave	619	France	Female	42	2	0.00	1	1	1

      Count
                                                                                                          4000
        2000
                                                                                                          3000
# sns.kdeplot(x='Age', data=churn, hue='Exited')
sns.histplot(x='Age', data=dataset, kde=True)
```

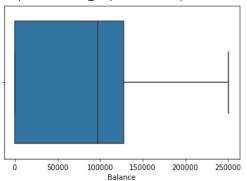

sns.kdeplot(x='Age', data=churn, hue='IsActiveMember')
sns.histplot(x='CreditScore', data=dataset, kde=True)

<matplotlib.axes._subplots.AxesSubplot at 0x7ff3752b6690>

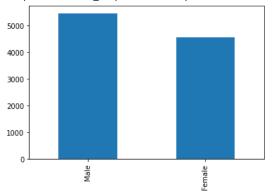

<matplotlib.axes._subplots.AxesSubplot at 0x7ff371cf2e90>

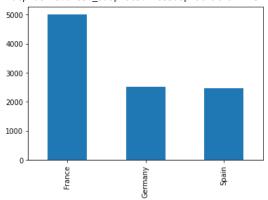

dataset['Gender'].value_counts().plot.bar()

<matplotlib.axes._subplots.AxesSubplot at 0x7ff371c2c190>

dataset['Geography'].value_counts().plot.bar()

<matplotlib.axes._subplots.AxesSubplot at 0x7ff371cd1f90>

→ Bi - Variate Analysis

import matplotlib.pyplot as plt

#create scatterplot of hours vs. score

plt.scatter(dataset.Age[:30], dataset.Balance[:30])

```
plt.title('Age vs. Balance')
plt.xlabel('Age')
plt.ylabel('Balance')

dataset.plot.hexbin(x='Age', y='CreditScore', gridsize=10)
```

Multi-variate Analysis

```
dataset.corr()

sns.set(font_scale=0.50)
plt.figure(figsize=(8,4))
sns.heatmap(dataset.corr(),cmap='RdBu_r', annot=True, vmin=-1, vmax=1)

#Three variables - Multivaraiate
sns.barplot(x='Age', y='Geography', data=dataset, palette='bright',hue='Gender')
```

4 . Descriptive statistics

```
import statistics as st

dataset[['Age', 'Balance', 'EstimatedSalary']].mean()

dataset.info()

dataset.describe()

dataset['Age'].median()

standard_deviation = dataset['CreditScore'].std()
print(standard_deviation)

st.mode(dataset['Geography'])

st.median(dataset['Age'])

st.variance(dataset['CreditScore'])
```

→ 5 . Handle Missing Values

```
dataset.isnull().sum() #no missing values
```

6 . Find and replace outliers

```
sns.boxplot(dataset['CreditScore'],data=dataset)

dataset['Balance'].hist()

for col in num_cols[1:]:
   print('skewness value of ',col,dataset[col].skew())

#Skewness should be in the range of -1 to 1, any columns with skewness outside of that range would have outliers

Q1=dataset['Age'].quantile(0.25)
Q3=dataset['Age'].quantile(0.75)
```

```
IQR
#Values above than the upper bound and below than the lower bound are considered outliers
upper = dataset['Age'] >= (Q3+1.5*IQR)
# print("Upper bound:",upper)
print(np.where(upper))
lower = dataset['Age'] <= (Q1-1.5*IQR)</pre>
# print("Lower bound:", lower)
print(np.where(lower))
#Removing outliers based off Age column
Q1 = np.percentile(dataset['Age'], 25,
                   interpolation = 'midpoint')
Q3 = np.percentile(dataset['Age'], 75,
                   interpolation = 'midpoint')
IQR = Q3 - Q1
print("Old Shape: ", dataset.shape)
# Upper bound
upper = np.where(dataset['Age'] >= (Q3+1.5*IQR))
# Lower bound
lower = np.where(dataset['Age'] <= (Q1-1.5*IQR))</pre>
''' Removing the Outliers '''
dataset.drop(upper[0], inplace = True)
dataset.drop(lower[0], inplace = True)
print("New Shape: ", dataset.shape)
dataset
for col in num_cols[1:]:
 print('skewness value of ',col,dataset[col].skew())
# Now we have reduced the Age column's skewness values within -1 to 1 range
# We left the Exited column's skewness value as it is the dependent varaible
```

7 . Check for Categorical columns and perform encoding

Label encoding and One Hot encoding

```
dataset.reset_index(inplace=True)

from sklearn.preprocessing import LabelEncoder
from sklearn.preprocessing import OneHotEncoder
from sklearn.compose import ColumnTransformer

categorical_feature_mask = dataset.dtypes==object
categorical_cols = dataset.columns[categorical_feature_mask].tolist()

categorical_cols=categorical_cols[1:]
categorical_cols=categorical_cols[1:]
categorical_cols

le = LabelEncoder()
dataset[categorical_cols] = dataset[categorical_cols].apply(lambda col: le.fit_transform(col))
dataset[categorical_cols].head(10)

categorical_feature_mask
```

```
enc=OneHotEncoder()
enc_data=pd.DataFrame(enc.fit_transform(dataset[['Geography','Gender']]).toarray())
enc data
#First three columns of enc_data is for Geography and the next two columns is for Gender, we can replace the already existing cate
#Dropping already existing Geography and Gender columns
dataset.drop(['Geography'], axis=1,inplace=True)
dataset.drop(['Gender'], axis=1,inplace=True)
dataset.insert(2, "Geography_France", enc_data.iloc[:,0], True)
dataset.insert(3, "Geography_Germany", enc_data.iloc[:,1], True)
dataset.insert(4, "Geography_Spain", enc_data.iloc[:,2], True)
dataset.insert(5, "Gender_Female", enc_data.iloc[:,3], True)
dataset.insert(6, "Gender_Male", enc_data.iloc[:,4], True)
dataset
# We drop some irrelevant columns that does not contribute to prediction
dataset.drop(columns="CustomerId",axis=1,inplace=True)
dataset.drop(columns="Surname",axis=1,inplace=True)
dataset.drop(columns="index",axis=1,inplace=True)
dataset
```

8 . Split the data into dependent and independent variables

```
X= dataset.iloc[:,:-1].values #Indepedent variables
y= dataset.iloc[:,-1].values #Dependent varaibles
Χ
     array([[1.0000000e+00, 0.0000000e+00, 0.0000000e+00, ..., 1.0000000e+00,
             1.0000000e+00, 1.0134888e+05],
            [0.0000000e+00,\ 0.0000000e+00,\ 1.0000000e+00,\ \dots,\ 0.0000000e+00,
             1.0000000e+00, 1.1254258e+05],
            [1.0000000e+00, 0.0000000e+00, 0.0000000e+00, ..., 1.0000000e+00,
             0.0000000e+00, 1.1393157e+05],
            [1.0000000e+00, 0.0000000e+00, 0.0000000e+00, ..., 0.0000000e+00,
             1.0000000e+00, 4.2085580e+04],
            [0.0000000e+00,\ 1.0000000e+00,\ 0.0000000e+00,\ \dots,\ 1.00000000e+00,
             0.0000000e+00, 9.2888520e+04],
            [1.0000000e+00, 0.0000000e+00, 0.0000000e+00, ..., 1.0000000e+00,
             0.0000000e+00, 3.8190780e+04]])
     array([1, 0, 1, ..., 1, 1, 0])
```

9 . Scale the independent variable

```
-1.00428491, -0.12716553],
